Abstract—The purpose of this study was to determine whether there were differences in the prevalence of musculoskeletal disorders among different types of workers in the garment industry. The study included 600 female workers from two garment factories in Mexico City. Data were collected by means of a self-administered questionnaire that assessed demographic characteristics, work conditions, and symptoms of musculoskeletal disorders. Results showed that the prevalence of musculoskeletal disorders was higher among workers who performed sewing tasks than among those who performed finishing tasks. This finding suggests that the type of work may be related to the prevalence of musculoskeletal disorders.

The diagram illustrates a 2D hexagonal lattice structure. The lattice is composed of red and blue squares. Red squares are located at the corners of the hexagons, while blue squares form the sides. The diagram shows a portion of the lattice with boundary conditions indicated by arrows and labels 'W' and 'E'.
